

Title
Neurobiochemistry Event Atlas: Molecule-to-Circuit Signatures (Foundational v1.0)

Overview

This dataset organizes neurobiochemistry as event chains from molecular mechanisms to synaptic effects, circuit-level signatures, and expected readouts. The structure supports teaching, concept mapping, and translational reasoning exercises.

What is different in this dataset

- Uses event-centric IDs (event_id) rather than concept-only rows.
- Includes compartment-level localization (primary_compartment).
- Separates acute synaptic effects from circuit-level signatures.
- Adds expected readouts to support hypothesis and assay planning.

Intended use

- Neurobiochemistry and neuroscience teaching
- Mechanism-to-readout study design
- Flashcard and quiz generation
- Knowledge graph seeding

Not intended for

- Clinical diagnosis
- Treatment decisions
- Guideline substitution
